Introduction

Contact

If you have any **question or suggestion**, feel free to contact the development team by phone or email:

- integraciones@grupocdv.com

API Introduction

Cdv' API is based on the **REST** architecture, consumed through HTTP requests (*POST, GET, PUT y DELETE*). The requests and responses are structured in **JSON** and validated against a scheme before being processed.

All requests are validated in **two steps**. **First**, the request *(*only *POST OR PUT)* is compared against a scheme[1] that defines the structure to be followed by the request. The schemes are available to be studied; they are found in the description of each method. The **second** validation is at the requested data level, expired reference tokens... More information in the 'Error Control' section.

User authentication is performed on each request through basic HTTP[2] authentication. No IP validation is implemented.

Workflow

Booking

The first request is an **availability search** using the `availability` method; this will return every available hotel with rooms, rates, boards, prices and cancellation policies.

Once the client has chosen a room, a prebooking will be carried out, verifying that there is a real availability, the price and the final cancellation policies. This is achieved using the `fareinfo` method.
With this method you will also get **additional rates** for the chosen regime, for example, if you choose a NOR (*normal*) rate, NRF (*non-refundable*) rates will be shown and vice versa.
To **make the reservation** it is only needed to send the information of the titular guests (one per room), for this we use the `createReservation` method.

---

1 JSON scheme is a vocabulary that allows you to validate JSON documents. More info: https://json-schema.org

2 More info: https://en.wikipedia.org/wiki/Basic_access_authentication#Client_side

Error Control

Any type of **error** is notified by an error message. This response **always follows the same structure** to facilitate the handling of errors (*searches without availability, invalid request format, recovery of non-existing reservations, etc*.).

```
{
    "error-list":
        {
            "code":0,
            "message":"Credenciales de acceso incorrectas."
        }
}
```

Description of Methods

Availability

Returns the availability for a given search. it is only possible to search by **zone** or list, with no **hotel** limit. (*separated by comma*).

The **maximum number of rooms** that can be requested is 5.
We recommend establishing the actual age for INF guests (*children*), maximum 3 per room and the default age (30) for ADT guests (*adults*), maximum 6 per room.

Availability can be requested for the same destination on three different dates at the most.

In addition, you can choose the type of search, depending on the reservations that come out of that search you will be invoiced in a special regime of a travel agency or in a general regime with the VAT stated separately.

Method: POST
Endpoint: url/rest/hotel/v2/availability

```
{
"date-in": [ "2019/10/20", "2019/10/30" ],
"date-out":[ "2019/10/21", "2019/11/02" ],
"destination-id":"Z_3588",
"room-list":[
{
"adt":"2",
"cnn":"2",
"cnn-age-list":[2,3]
}
],
"nationality":"ES",
"search-type": 0,
"language":"ES",
"currency":"EUR"

}
```

Property name	Type	Description
date-in	Array	Contains all the available entry dates. Min: 1, Max: 3. Format yyyy/mm/dd
date-out	Array	Contains all the available departure dates. Min: 1, Máx: 3. Format yyyy/mm/dd
destination-id	String	Zone code/Hotel code search It is constructed in the following way: If it is a hotel prefix **'H_'** to the hotel code. Example: H_38660 If you want to run a multiple hotel code search you can separate them with commas: Example: H_38660,H_38668,H_38669. If it is a zone prefix **'Z_'** to the zone code. Example: Z_3588
room-list	Array	Contains all the rooms with the disposition of the guests in each room.
Adt	Integer	Number of adults
Cnn	Integer	Number of children
cnn-age-list	Array	Children ages array
Nationality	Integer	Nationality of the person responsible for the reservation. **ISO 3166/2**
search-type	Integer	The value will be **0** if we want to be invoiced in a special regime of travel agencies or **1** if we want a general regime with an itemized VAT.
Language	string	Language. **ISO 3166/2**
Currency	string	Currency in which rate is returned. **ISO 4217**

price-cost	Float	Provider Price

Pvp	Float	Sale Price
cancellation-deadline	Date	Cancelation deadline without expenses
payment-deadline	Date	Payment deadline before automatic cancelation
price-provider-pvp	float	Provider price

Fare-info

Checks that the selected option is available before closing the reservation and returns all the updated data of the selection, by using your `@Key`.

The pricing involves making sure that the **dates of payment and cancellation** are real, since the dates and prices obtained in the availability may vary before closing the reservation.

This method will also return **additional fare options** for the selected regime. For example, if an option with an NRF (*non-refundable*) rate code has been charged, an NOR (*normal*) option may appear.

Method: POST
Endpoint: url/rest/hotel/v2/fare-info

```
{
"trace-id": "7e850012-53e6-4164-83d3-789fa78f1dae",
"key":"B89AC161113647B5A102D519D2B93FC8"
}
```

Property name	**Type**	**Description**
trace-id	String	Identifier of the file that contains the object. This data is returned in the availability response.
Key	String	Identifies the option chosen by the client. This data is returned in the availability response.

Response

The response follows the same structure as availability. Adding the **additional-info** field, that includes relevant information about the conditions of the reservation that is indispensable to show to the client.

        "description": "Este bonito hotel está ubicado en la zona residencial de Vistahermosa, un
vecindario muy tranquilo a tan sólo 800 metros de la autopista AP-7. La propiedad está muy bien
conectada con el Aeropuerto de Alicante y el centro de exposiciones. Tanto la playa como la ciudad
de Alicante están a tan sólo 3 kilómetros. Este asombroso establecimiento ofrece una elegante
recepción con servicio de 24 horas. Los ejecutivos en viaje de negocios tendrán a su disposición
salas de conferencias y conexión LAN inalámbrica a internet. Además, el hotel también cuenta con
aparcamiento. Las habitaciones son muy cómodas y están amuebladas y decoradas con una acertada
paleta de tonos cálidos que satisfarán las necesidades de los huéspedes tanto en viaje de negocios
como de placer. La piscina exterior y su terraza con tumbonas y sombrillas se antojan el lugar ideal
para relajarse, si bien el hotel también dispone de gimnasio, sauna y piscina de hidromasaje.",

}
```

Property name	**Type**	**Description**
room-group	Array	Reservation data
Type	String	Guest type
Name	String	Guest name
Surname	String	Guest last name
Key	String	Identifies the option chosen by the client. This data is returned in the availability response
Special-request	String	Observations added to the reservation. The observations are sent to the provider but are not guaranteed under any circumstances.

Expedient	String	Reservation internal file

Response

Returns the locator and the status of the reservation:

```
{
        "locator":"2019447125",
"dateIn": "2019-10-10",
"dateOut": "2019-10-11",
"hotel": "Mk Hong Kong",
"name": "RICHIE",
"surname": "JAYA",
"price": 91.25,
"status":"confirmed"

}
```

Property name	Type	Description
locator	String	Reservation locator
dateIn	date	Reservation check-in.
dateOut	date	Reservation check-out
hotel	String	Hotel name.
name	String	Name of the reservation holder
surname	String	Surname of the reservation holder
price	Float	Booking price
status	String	Reservation status

Retrieve

It returns the details of one booking by locator.

Método: GET
Endpoint: url/rest/hotel/v2/retrieve/{locator}

Response

Return state and the most important booking data:

```
{
```

```
   "runtime": 0.17887091636657715,
   "booking":    [

             "locator": "19195",
             "status": "Confirmed",
             "dateIn": "2019-10-10",
             "dateOut": "2019-10-11",
             "hotel": "Mk Hong Kong",
             "name": "RICHIE",
             "surname": "JAYA",
             "price": 91.25

     ]
}
```

Cancel

Cancel a reservation by its locator.

Method: DELETE
Endpoint: url/rest/hotel/v2/cancel/{locator}

Response

We obtain the same response than the one returned by the retrieve method. To check if the reservation has been canceled successfully; the status of the reservation will be canceled.

Booking-List

It returns the details of the booking searched or list of bookings created during the period indicated indicated.

Method: POST
Endpoint: url/rest/hotel/v2/booking-list

```
{
"locator":  "",
"date-from": "2019-10-20 00:00:00”,
"date-to": "2019-10-21 23:59:59"

}
```

Property name	Type	Description
Locator	string	Reservation locator
date-from	datetime	Date and time: Start of the reservation
date-to	datetime	Date and time: End of the reservation

Response

Returns status and data of filtered reservations:

```
{
   "runtime": 0.17887091636657715,
   "booking-list":    [
            {
             "locator": "19195",
             "status": "Confirmed",
             "dateIn": "2019-10-10",
             "dateOut": "2019-10-11",
             "bookDate": "2019-04-01",
             "hotel": "Mk Hong Kong",
```

```
            "name": "RICHIE",
            "surname": "JAYA",
            "price": 91.25

          },
           {
            "locator": "12591",
            "status": "Confirmed",
            "dateIn": "2019-10-10",
            "dateOut": "2019-10-11",
            "bookDate": "2019-04-01",
            "hotel": "Iberostar Playa Alameda",
            "name": "EDUARDO|CARLOS|ELENA ",

longitude	string	Hotel longitude

Hotel List Searcher

List of active hotels, searching for coincidences.

Method: GET
Endpoint: url/rest/hotel/v2/static/hotel-list/

```
{
"text-search": "melia"
}
```

Property name	Type	Description
text-search	string	Contains the words to search for the matches in the name of the hotel. In case of an empty string, the entire list of hotels is

		returned

Response

```
{
"runtime": "0.819",
"hotel_list": [
{
"cod": 44,
"name": "PORTO EDA",
"zone_cod": "6"
}
}
```

Property name	Type	Description
hotel_list	array	Hotel list
Cod	integer	Hotel code
Name	string	Hotel name
zone_code	integer	Zone code

Hotel Rooms

Hotel rooms list.

Método: GET
Endpoint: ruta/rest/hotel/v2/static/hotel-rooms/{idHotel}

Respuesta

```
[
{
"cod": "201317258",
