Dishant Pandauria *Software Engineering Specialist*

www.linkedin.com/in/dishant-pandauria dishant.pandauria29102001@gmail.com +91-8827726327

SKILLS

Language: Golang, Java, Python and C++ • **Databases:** Cassandra (Scylla/AWS Keyspaces), MongoDB, PostgresDB, , Redis Cache (data store), NoSQL, MySQL, S3(data lake) • **Frameworks:** Gin, Wire, Gorm, Gingko, JUnit, Log4j • **Big data:** Microservice Architecture, Kafka, PySpark • **AWS Cloud technologies:** Keyspaces, EKS, EC2, , SQS, S3, SES, IAM, KMS, ALB • **CI/CD:** Docker, Kubernetes, ArgoCD, Jenkins • **CSE Fundamentals:** Object Oriented Programming Concepts, Operating Systems, Database Management System, Computer Networking, Data structures and Algorithm, Problem Solving • **Tools:** Goland, Cursor, Intellij, Git and Github, Android Studio, Jira, Splunk, SignalFx, Azure Devops, Confluence

PROFESSIONAL EXPERIENCE

Omniful, *SDE-2* Mar 2025 – present | Gurgaon, India

- Operate in a **fast-paced startup environment**, contributing to rapid feature development, cross-functional collaboration, and iterative improvements based on real-time feedback from stakeholders.
- **Led the migration of the shipping service from Ruby on Rails to a Golang-based microservice**, building the system from scratch and implementing **40+ RESTful APIs** to support core shipping workflows and integrations.
- Contributed to the development of **RABT**, a warehouse rental platform enabling Omniful to monetize client warehouse listings by taking a margin in the rental business.
- Designed and implemented RESTful **API endpoints** for warehouse listings and associated categories, integrated on the RABT dashboard.
- **Implemented Redis-based caching** for listing and category APIs to improve system performance and reduce database load.
- Wrote comprehensive **unit tests** for all API modules to ensure reliability.
- Worked with **MongoDB** for flexible and scalable document storage of warehouse data.
- Followed **MVC-based API architecture** to maintain clean separation of concerns and facilitate easy code maintenance.
- Leveraged **Google Wire** for dependency injection, improving testability and code modularity across services.

GE Vernova

Software Engineering Specialist Jul 2022 – Feb 2025 | Hyderabad, India

- Demonstrated expertise in **distributed systems** by contributing in a successful migration of a critical time-series data platform from Scylla DB to AWS Keyspaces (migration of 400TB of historical and live streaming data), **resulting in significant savings of $1.5 million in licensing costs and a 30% improvement in query performance.**
- Optimized data storage and retrieval strategies using techniques like read-before-write, table hashing and removing unnecessary columns in golang applications, significantly **reducing data storage costs by 20%.**
- Developed and optimized a feature in Golang to analyze customer usage of yearly data entitlements, including data points consumed, stored in **Amazon RDS (PostgreSQL)** using GORM library. Improved RDS efficiency by consolidating daily consumption records into a single entry via a scheduled **squash cron job**. Designed a **SignalFx dashboard** for visualizing consumption data and monthly averages, supporting in-depth monitoring and customer usage optimization.
- Collaborated closely with cross-functional teams to ensure a smooth migration and minimize disruptions to production services**, resulting in a 99.99% uptime.**
- Successfully migrated multiple time-series applications from Cloud Foundry to AWS EKS, leveraging Kubernetes best practices and automation tools.
- Designed and implemented a centralized configuration management system using Helm charts to **simplify application deployment and management by 75%**.
- Optimized application performance and resource utilization through careful tuning of Kubernetes resource requests and limits, **resulting in a 30% reduction in costs**.
- Integrated **X-ray scanning** for Go components to identify vulnerabilities, enhancing the security of backend applications.

- Implemented multiple **Spark jobs** to migrate large volumes of data from Scylla to various target systems, optimizing data processing workflows helps in identifying vulnerabilities and making our components more secure.

Digital Technology Intern (6 months) Jan 2022 – Jun 2022 | Bangalore, India

- Assisted in developing backend applications using Java and Spring framework, contributing to new feature design and implementation.
- Actively participated in Agile processes, collaborating with team members to deliver features within tight deadlines.
- Developed JUnit test cases to ensure high-quality code and reliable application performance.

EDUCATION

NIT Bhopal, *B. Tech, CSE* Jul 2018 – May 2022 | Bhopal, M.P.
CGPA - 7.56

PROJECTS

Notification & Task Management System
Tech Stack: Golang, Gin, PostgreSQL, MongoDB, Kafka, AWS SQS, Redis, S3, Docker, CSV
Built a scalable, end-to-end task management platform in one week, featuring real-time and scheduled notifications with background processing and clean service-based architecture.

- Developed a fully functional REST API using **Gin (Golang)** for task creation, updates, CSV uploads, file handling, and filtered retrieval.
- Designed a **PostgreSQL schema** for tasks and users with constraints, indexes, and auditability.
- Used **MongoDB** to log activity history (status changes, updates) with structured audit documents.
- Integrated **Kafka** for real-time event streaming to trigger immediate notifications.
- Leveraged **AWS SQS** for scheduling reminder jobs based on due dates (e.g., 1-day prior reminders).
- Used **Redis** for caching task metadata and managing temporary reminder state.
- Supported CSV-based task ingestion and file attachment storage using **S3 with pre-signed URL support**.
- Structured code with clean architecture: interfaces for messaging, caching, file storage, and DB.
- Documented full API spec and schema design; included Docker setup for local deployment.

AWARDS

Lead with Transparency, *Engineering Award Q1'24*
Awarded for exceptional performance and dedication in database and platform migrations, aligning with agile methodology and collaborative project execution.

Spark Award, *Engineering Award Q3'24* 19 Sep 2024
Awarded for successfully migrating multiple time-series applications from Cloud Foundry to AWS EKS, leveraging Kubernetes best practices and automation tools

CERTIFICATES

Ultimate Big Data Master Program by Sumit Mittal
Big Data Technologies (Pyspark in depth, Hadoop, Mapreduce)

GenAI Workshop by AWS
Took training on AI/ML to understand various models provided by Amazon Bedrock API
