# Senior Golang Developer

We're building something audacious, something global, in next tech at **Mai Labs**: a new digital infrastructure layer, an internet architectural rail that puts users, builders, creators and developers first. Our mission? To distribute participatory power to billions of people in the digital economy.

**What this actually means:**

- We're developing our own blockchain and entire ecosystem to make digital infrastructure efficient, secure and more accessible.
- We're creating products and tools for web 3.0 world, in shape of tokenization, yield generation, Dapps to allow users to build real-world assets into tradeable digital tokens.
- We're building a photorealistic immersive platform where creators can design immersive environments (think: next-gen Minecraft meets professional design tools).
- We're tackling the hard problem of protecting user rights, digital intellectual property rights and protection of assets in an age of AI and instant replication.

Our team is working on bleeding-edge tech across blockchain, and distributed systems – with real world problem solving and common utility. We're taking on established paths and conventional wisdom about how the Tech and Internet should work.

Our start-up journey involves constant evolution and adaptation to market dynamics. People work on strategizing entirely new systems to complete hands-on, within same week. Resources consciousness is high and job titles are almost flat. But you get freedom to operate across products, do your best work, and will stand ahead in tech curve.

If above resonates with you, let’s talk.

**Current Role:** Senior Golang Developer L2/L3
**Location:** Noida (Hybrid/ Remote)

We are looking for a Senior Golang developer with a strong understanding of how best to leverage and exploit the language’s unique paradigms, idioms, and syntax.

**What will you get to do?**

- Design and develop high-performance, scalable, and maintainable applications using Golang.
- Lead architectural decisions, contributing to a robust microservices and distributed system design.
- Collaborate closely with cross teams to implement new features and enhance existing functionality.
- Optimize and debug applications to improve performance, efficiency, and reliability.
- Write unit and integration tests to ensure code quality, maintainability, and stability.

**Qualifications:**

- Bachelor's/master's degree in computer science, Computer Engineering or related fields.
- 5+ years of strong experience in Golang programming, DSA and System Design.
- Good experience in writing scalable, robust, testable, efficient, and easily maintainable code.
- Good experience in troubleshooting and debugging issues with existing code & Optimization.
- Familiarity with microservices, serverless architecture, and containerization.
- Write unit and integration tests to ensure code quality and stability.
- Proficiency in database technologies like MySQL, MongoDB, etc.
