Professional Summary

Highly experienced Backend & Blockchain Developer with 4+ years in designing and developing scalable, high-performance distributed systems. Proven ability to contribute across the full development lifecycle, with a strong focus on optimizing system efficiency and reliability. Eager to leverage expertise in Golang, Solidity Blockchain, and cloud technologies to drive organizational success.

Skills:

Golang Blockchain & Tokenization Ethereum Hyperledger Fabric Microservices Distributed Systems REST-API gRPC Go-ethereum HD-Wallet Fabric-gateway GinGonic GoFiber GORM IBM-Sarama Docker Kubernetes MariaDB KeyDB MiniFabric TaskFiles Kafka Helm Truffle Ganache Solidity

Experience:

Senior Associate Blockchain Developer
National Payments Corporation of India - Senior Associate software developer
(March 2023 - Present)

- Contributed to the design and development of **eRupee : Retail-CBDC**, a national-scale digital currency initiative by the Reserve Bank of India (RBI), impacting **5M users and 420K merchants** across India, by implementing core modules such as indent, token issuance, and token redemption using a hexagonal architecture with modular, layered components and distributed tracing/logging capabilities.
- Developed smart contracts using **openzeppelin** and **hlf-contractapi** using solidity & golang. Also configured private chains for **ethereum** & **hl-fabric** using hL Besu, CouchDB, Private Data Collections (PDC) & Minifabric.
- Implemented onboarding clients using **go-ethereum & hlf-gatewayclient**. Also Extended clients for multi-peer support and exponential retry mechanisms to reduce transaction failure rates and improve network resilience.
- Configured Ethereum wallets using **go-ethereum** for **cross functioning wallets** between ethereum & hyperledger fabric
- Engineered and optimized robust backend services using golang, working extensively with frameworks like **go-fiber**, integrated with **grpc** and **kafka** for inter-service communication. Leveraged **protocol-buffers**, **json**, **gorm** for DB access, **go-redis** for KeyDB interactions, and **IBM sarama** for kafka integration.
- Designed and implemented performance improvements that increased system efficiency by **75%** through **concurrent processing** and non-blocking request handling, while stabilizing platform reliability by reducing L1-L2 support overhead and **cutting production bugs by 40%** through idempotency and rollback-safe flows.
- Led UAT and production deployment coordination with RBI and 10+ partner banks (including HDFC, UBI, IndusInd and Yes Bank), contributed to sanity testing, containerized local development using **docker**, **kubernetes**, **dev-container**, **skaffold**, **cloud-code**, and **kompose**, and mentored a pod of junior developers across the full SDLC on best practices in coding, testing, and system design.

Associate Backend Developer
Maharashtra Knowledge Corporation Ltd - Associate software developer
(April 2021 - February 2023)

- Contributed to the architecture and development of a scalable **e-learning platform ERA** serving over **1 million learners annually**, using **golang**, **custom file system operations**, and **mariadb**, with a focus on system performance, maintainability, and high-availability in real-world usage.
- Enhanced the framework by designing and integrating **concurrent reporting modules**, improving data processing and enabling faster, more reliable analytics; introduced new capabilities to support learning feature workflows.
- Developed a full-fledged **simulation module** from scratch, implementing **REST APIs**, **structured logging**, **file storage handling**, and **caching logic**, while also achieving a **30% performance gain** through targeted server-side optimization.

Developer (Self-Initiated Project)
NFTLedger
(March 2025 - Present)

- Developed a **Decentralized NFT platform** with ERC-721 standards utilizing **go-ethereum** for Ethereum client interactions and **IPFS** for secure, immutable storage of NFT metadata and digital assets. The system was designed to enable efficient minting, transfer, and management of NFTs on the Ethereum blockchain.
- Built and deployed Solidity smart contracts for NFT minting and transaction logic using the **truffle** framework. Deployed contracts to a local test network powered by **ganache**, and utilized **abigen** to automatically generate go-client code for seamless interaction with the smart contracts, including handling blockchain events and transactions.
- Implemented **grpc & rest endpoints** for communication between the backend and planned frontend, ensuring scalable and high-performance data transfer. The application architecture is designed to allow easy integration with a **htmx & SSE** frontend in the future, providing a user-friendly interface for managing and displaying NFTs once developed.

Achievements:

- Awarded the title of **Blockchain Wizard** in an organization-level hackathon conducted by NPCI, competing among 700+ participants from across the organization.

Education:

Bachelor of Computer Engineering [JULY 2016 - MAY 2020]
Amrutvahini College of Engineering, Sangmaner

- Graduated with First Class with Distinction (SGPA: 7.99) in Computer Engineering from Pune university.
- Along with academic, done exploration & seminars in the Blockchain domain
- Completed major project in private blockchain on Government fund allocation and distribution system

Certifications:

- Certified Hyperledger Fabric Developer by Kerala Blockchain Academy
- Certified Kubernetes Application Developer by Udemy

Hobbies:

I am an artistic introvert who likes to spend time with nature & novels. In my free time I write poems, draw sketches and do plant grooming.
